Thobeka Mthethwa

BI and Data Developer | SQL | Power BI | Python | Data Integration and Reporting
Durban, South Africa | +27 67 915 0257 | mthethwathobeka49@gmail.com

PROFESSIONAL SUMMARY

Early-career BI and Data Developer with an Advanced Diploma in Information and Communication Technology: Business Intelligence (NQF Level 7) and a Diploma in ICT: Business Analysis from Durban University of Technology. Experienced in SQL, Python and Power BI, with hands-on work in ETL pipelines, data transformation, validation and reconciliation across multiple source datasets. Currently supports enterprise systems (SAP S/4HANA and SAP SuccessFactors): troubleshooting data and system issues, documenting findings and requirements, and providing first-line support to business users. Skilled at translating business needs into technical solutions and explaining data clearly to technical and non-technical stakeholders.

TECHNICAL SKILLS

- **Scripting and Automation:** Python (Pandas, NumPy, Matplotlib, scikit-learn), SQL, data-processing scripts, repeatable data tasks
- **Databases and SQL:** SQL, Microsoft SQL Server, PostgreSQL, DBeaver, data extraction, data transformation, querying
- **ETL and Data Pipelines:** ETL, data pipelines, staging layers, data integration, data warehousing, dimensional modelling, star schema, fact and dimension tables, surrogate keys
- **Data Quality and Reconciliation:** data profiling, data cleansing, data validation, data reconciliation, data mapping, data integrity, data governance
- **BI and Reporting:** Power BI, DAX, Power Query, Tableau, Excel, dashboards, KPI reporting, report development, reporting datasets, data models
- **Systems and Troubleshooting:** SAP S/4HANA, SAP SuccessFactors, incident investigation, root-cause analysis, escalation with clear diagnostics, user support
- **Documentation and Analysis:** technical documentation, data mappings, Business Requirements Documents (BRD), process mapping, functional documentation, requirements gathering
- **Testing:** User Acceptance Testing (UAT), functional testing, regression testing, defect tracking
- **Methods and Tools:** Agile, Scrum, SDLC, Jira, Git/GitHub, AWS, Lucidchart, Microsoft Visio
- **Professional:** stakeholder engagement, communication with technical and non-technical audiences, problem solving, managing work, leveraging feedback

WORK EXPERIENCE

Junior System Analyst | Durban University of Technology, Durban | March 2026 – Present

- Support enterprise systems (SAP S/4HANA and SAP SuccessFactors): investigate issues and user queries, identify root causes, and escalate complex incidents with clear documented diagnostics
- Identify data irregularities, system issues, risks and dependencies across systems; document findings and escalate to technical and functional teams
- Provide first-line support to business users on system and reporting queries
- Gather, analyse, validate and document business and system requirements through stakeholder workshops and follow-up sessions, translating them into BRDs, process flows and functional documentation
- Prepare and maintain reports and analysis that support system operations, stakeholder communication and business decisions
- Plan and run User Acceptance Testing (UAT): prepare test scenarios, record results and evidence, track defects and communicate outcomes to stakeholders
- Explain system and data findings clearly to non-technical business users

PROJECTS

ShopSmart Retail Data Warehouse (Group Project) | AWS, DBeaver, SQL, ETL, Dimensional Modelling

- Designed and implemented a cloud-based data warehouse integrating seven source datasets: online sales, store sales, customers, products, stores, inventory and promotions
- Built a staging layer and SQL ETL transformations to standardize dates, text and product codes, resolve duplicates, and map missing values to Unknown Customer and No Promotion dimension members
- Profiled source data and documented data quality issues (missing customer and promotion IDs, duplicate transactions, mixed date formats, inconsistent text), with a documented treatment rule and data mapping for each
- Designed a star schema with a sales transaction fact table, a daily inventory snapshot fact table, and date, product, customer, store and promotion dimensions, using surrogate keys and a defined fact grain
- Validated the warehouse with row-count and sales reconciliation, foreign key checks and duplicate key checks
- Wrote 15+ analytical SQL queries on sales trends, product and store performance, customer segments, promotions and stock risk, and produced management-focused BI outputs

Insurance Fraud and Risk Assessment System (Group Project) | Power BI, DAX, Power Query

- Cleaned, transformed and validated a 53,503-record insurance dataset in Power Query: checked data types, missing and duplicate values, and flagged 2,247 records with invalid policy dates using a Data Quality Flag
- Created derived fields (Record ID, Age Group, Credit Score Category, Policy Duration, Coverage to Income) to support analysis and dashboard filtering
- Developed a transparent rules-based risk score combining six indicators to classify records as Low, Medium or High risk, and a Potential Fraud Indicator to prioritize records for human review, using DAX
- Built a three-page interactive Power BI report: exploratory analysis, risk assessment with a prioritized investigation queue, and an executive dashboard with KPI cards, slicers and page navigation
- Tested the report with record-count, claim-total and risk-band reconciliations against the source data
- Documented limitations (synthetic data, no confirmed fraud labels) and recommended calibrating thresholds against confirmed outcomes

Business Intelligence Dashboard | Power BI, Excel

- Profiled a structured business dataset to identify data quality issues, including missing values, duplicates and outliers
- Built interactive Power BI dashboards and reports to analyse business performance
- Developed KPI reporting on revenue, customer behaviour, delivery performance and operational performance
- Applied RFM analysis and customer engagement segmentation to find meaningful business patterns
- Turned analytical findings into visual insights that support data-driven decisions

Data Warehouse and SQL Analytics Project | SQL, Star Schema, ETL

- Designed a star-schema dimensional data model, defining tables and the relationships between them
- Wrote SQL queries to extract, transform, analyse and report on business data
- Applied data warehousing and ETL concepts to structure data for analytical reporting
- Developed KPI queries to support business performance analysis and reporting

EDUCATION

Advanced Diploma in Information and Communication Technology: Business Intelligence (NQF Level 7) | Durban University of Technology | 2026

Diploma in Information and Communication Technology: Business Analysis | Durban University of Technology | 2025

Matric (National Senior Certificate) | Temple Valley Secondary School | 2022
